

GE Healthcare introduces Essential ultrasound system

30 January 2018 | News

The device is designed to deliver broad functionality for medical professionals.

GE Healthcare

GE Healthcare has come up with a new ultrasound system developed for a range of medical applications, termed as Versana Essential.

The device is designed to deliver broad functionality for medical professionals from obstetrics and gynaecology to GPs and family doctors, for an affordable price.

It comprises of high-end image quality with advanced yet easy-to-use features. Tools such as the Whizz one-touch dynamic image optimisation and Auto IMT measurement features allow clinicians to focus on the needs of their patients rather than adjusting parameters.

The company is hopeful that Versana Essential results in fewer referrals to more costly facilities for diagnosis, while bolstering patient confidence in their primary care providers. Flexible financing options will be offered by the manufacturer to make the system easy to own.
