

International Freezer Challenge 2019: Environmental protection at -80°C

January 17, 2019 | News

Global warming is a challenge for mankind on earth. Sustainability discussions primarily focus on energy consumption of devices.

Even environmentally friendly and energy efficient ultra-low temperature freezers traditionally consume a large amount of energy as they maintain extremely low temperatures 24 hours a day, 7 days a week, for years.

The International Institute for Sustainable Laboratories (I2SL) and My Green Lab have partnered again to reward the best concept to improve cold storage regarding sustainability: The Freezer Challenge 2019.

The users can earn points by taking actions from Good Management Practices, Temperature Tuning, and other areas, as well as for sharing information about best practices. Awards will be given to those who have done the most to save energy and improve their sample storage.
