

WHO launches app to improve elderly care

02 October 2019 | News

The innovative interactive digital application is known as WHO ICOPE Handbook App

On the International Day of Older Persons – 1 October – the World Health Organization (WHO) has launched a package of tools, including a digital application to help health and social workers provide better care for older people.

The innovative interactive digital application known as WHO ICOPE Handbook App provides practical guidance to address priority conditions including mobility limitations, malnutrition, vision and hearing loss, cognitive decline, depressive symptoms and social care and support. Used in conjunction with a package of tools including a new handbook, the app will accelerate training of health and social workers to better address the diverse needs of older people.

The Integrated Care for Older People package of tools is the result of two years of extensive consultations with leading experts and stakeholders including civil society representatives.

The 2030 Agenda and the Sustainable Development Goals recognize that development will only be achievable if it is inclusive of people of all ages. Empowering older persons and enabling their full participation and social inclusion in good health are ways to reduce inequalities.
