

Celemics releases comprehensive NGS target enrichment workflow

16 October 2019 | News

Partnering With BlueBee on a Global Genomics Data Solution

South Korea based Celeemics, provider of NGS target enrichment kits and innovative sequencing platforms, has announced the release of a comprehensive NGS target enrichment workflow for clinical and translational research applications.

To serve as an end-to-end workflow with integrated genomic data analysis, Celeemics partnered with BlueBee, an industrial-grade and highly configurable data platform provider, to develop a bioinformatics solution tailored for their assay and end-user experience. Collaborative efforts between these two industry leaders produced the Celeemics web solution, offering a new level of accessibility to users of target enrichment NGS assays.

The Celeemics web solution will act as a springboard to propel research towards precision medicine and provide Celeemics with an extensible, highly efficient and scalable data strategy poised for growth.

The Celeemics web solution is a turnkey analytics option, transforming raw data into actionable results as part of the Celeemics NGS target enrichment kit portfolio. "Data analysis is a critical workflow area with potential for streamlining," says Dr. Hyoki Kim, CEO Celeemics. "We chose BlueBee to address the data analysis bottleneck for our customers with a platform that fits precisely with our assay. The Celeemics web solution standardizes the digital end of the workflow, is high-performance, and provides ease of use. This strategic product extension is directly in line with our company mission of accelerating precision medicine, which we are thrilled to make tangible for a global market," Dr. Kim adds.

Leveraging BlueBee's Genomics Platform, Celeemics is able to serve an expanding global market with clinical-grade data compliance and guaranteed data residency for customers in Europe, Asia, and beyond. The administrator features of the platform ensure that Celeemics remains in complete control of their pipeline and operations. The streamlined user interface enables end-users with any level of expertise to analyze, interpret, and return actionable results from their sequencing workflow. Celeemics end-users may also work collaboratively, providing secure, permissioned, and audited access of project data and analyses.
