

China's Huami Corp invests \$5M for disruptive MRI technology

12 February 2021 | News

Invests in Hyperfine Research D Round to support the application

China's Huami Corp has announced that it has invested \$5 million in Hyperfine Research's D round of funding, which closed on February 3, 2021. Huami's mission is to connect health with technology, developing both consumer and industrial health technologies.

The company believes its miniaturization engineering expertise dovetails with efforts to miniaturize medical imaging technology which can disrupt the locations, applications and costs of medical imaging. Hyperfine Research is pioneering MRI imaging with its portable Swoop system, which received FDA 510(K) clearance in August of 2020.

"In the same way that new depth and granularity of data from wearable devices has changed health population management, we see the miniaturization of imaging technology changing the places and speed at which clinicians can evaluate patients," said Huami's chief operating officer, Mike Yeung.
