

SAS analytics empowers the development of life-saving drug and vaccines

23 February 2021 | News

Updated SAS clinical analysis software helps improve the development and safety of new pharmaceuticals, including COVID-19 vaccines

Facing the challenges of COVID-19, health and pharmaceutical organizations globally are innovating and digitally transforming clinical research analytics – from getting trials up and running, to modernizing trial designs, to delivering new therapies and vaccines faster. Supporting clinical-trial modernization is the updated [SAS® Life Science Analytics Framework](#), which helps transform data into life-changing insights and deliver better, safer therapies to patients faster in a highly regulated landscape.

“Clinical development is at an inflection point with accelerated development for new therapeutics and vaccines for COVID-19, coupled with a move toward decentralized, virtual hybrid clinical trials,” said Mark Lambrecht, PhD, Global Director of the Health and Life Science Practice at SAS. “In our SAS Health product portfolio, we continue to invest in industry-leading analysis solutions for small biotech entities just getting started in clinical development to large pharmaceutical enterprises with thousands of users.”

SAS offered a demonstration of SAS Health and the updated SAS Life Science Analytics Framework during the virtual [PhUSE EU Connect](#) conference.

A singular analytics foundation for clinical research

For decades, health and life sciences organizations have relied on the SAS Life Science Analytics Framework – a single, open, cloud-based analytics solution for clinical research, with embedded analytic tools, support for data standards and optional integrated analytic applications. SAS Life Science Analytics Framework 5.3 is designed to reduce development timelines and drive modernization of clinical trials, while ensuring regulatory compliance. New functionality provides even greater efficiency:

- A seamless open-source integration with the ability to program in SAS, R or Python.
- Inclusion of study metadata and data standards enhancements for easier and more complete definition of study details.

- Automation of the development process for tables, listings and figures to ease tracking effort for clinical study report development.
- Addition of two-factor authentication for increased data security.

Ferring, a Swiss biopharmaceutical group, selected SAS as a long-term strategic analytics partner to support its mission. SAS helps Ferring deliver personalized health care solutions and optimize health outcomes by integrating pharmaceutical products with diagnostics, data, devices, education and support services.

“The SAS Life Science Analytics Framework, hosted and managed by SAS in a fully regulatory-compliant cloud environment, helps international virtual teams at Ferring and clinical research organizations (CROs) to access clinical data in the same way and continuously optimize working procedures,” said Bjarke Klein, Vice President of Global Biometrics at Ferring Pharmaceuticals. “This foundational solution enables execution of modern trial designs and has the potential to support decentralized clinical trials,” Klein added.

Going beyond clinical trial data

Health care researchers and regulatory agencies like the US Food and Drug Administration (FDA) need a more comprehensive view of patients to make confident decisions about health care, drug approvals and policy. But clinical trial data, electronic health records, claims data and adverse event reports are only snapshots of patients at random points in time. To provide real value, a holistic patient profile built with real-world data – or observational data collected beyond controlled clinical trials – is needed to achieve the greatest effect on health and wellness and to assess the safety and efficacy of new drugs and medical devices. SAS [Health: Cohort Builder](#) enables quick discovery and creation of patient cohorts for population health analytics, clinical feasibility analysis, safety and efficacy, and more.
