

PerkinElmer launches cloud based solution to enable remote lab management

23 November 2021 | News

The PKey Workflow Monitor offers 24/7 monitoring capabilities to ensure high productivity and throughput

PerkinElmer, Inc. has announced the launch of its PKey™ Workflow Monitor, a cloud-based platform enabling laboratory personnel to remotely manage and monitor their PerkinElmer instruments and workflows in real-time.

The PKey Workflow Monitor offers scientists and researchers 24/7 access and visibility into their laboratory operations. With a cloud-based web design and centralized summary dashboard, authorized users can monitor and view real-time status updates, receive notifications, run completion data and view video clips remotely from their office, a meeting or the comfort of their homes.

With the option to receive notifications via email or SMS, the PKey Workflow Monitor informs users of the start, stop and completion of operations. It can also notify users if manual intervention is needed, such as the replenishment of tips or need to refill reagents. With instruments enabled with video recording capabilities, the platform can also record and store specific events and errors, allowing authorized users to study them at a later date.
