

Korea's iMedisync develops world's first integrated wireless brain EEG

01 January 2022 | News

Overcome mental pandemic in just 10 minutes

iMediSync, a leading AI-driven early detection and therapeutic platform for optimal brain health from Seoul, South Korea has announced that the company is launching its comprehensive EEG solution (hardware + software + remote telehealth solution), to perform brain mental health screening & predictive analysis of potential mental conditions in just 10 minutes.

iSyncWave™ is an innovative brain-scanning device with high-quality dry Electroencephalogram (EEG) sensors that autofit to various sizes and shapes, keeping 10 to 20 system locations and equipped with matching sex/age Norm DB (database normalisation).

Recently with the addition of software upgrades, and an FCC (Federal Communications Commission) approval allowed the iSyncWave to be exported to the EU, Asia, and Australia already use for research and diagnostics.

iMediSync proposes an EEG-centric global vision of integrated telemental health care & CNS drug development platform while cooperating with various neurologists, hospitals in South Korea in the field of Clinical Depression, Parkinson's Disease, and other neuro-related diseases to expand the biomarker R&D pipeline. Active communication with global pharmaceutical companies are ongoing as well.
