Hong Kong opens Centre for Eye and Vision Research

June 13, 2022 | News

Located in the Hong Kong Science Park

At the forefront of the population's health and aging imperative and with its mission of generating innovative technologies and unique solutions designed to prevent vision loss and preserve healthy vision, the Centre for Eye and Vision Research (CEVR) has announced its official launch.

It is the first global hub to conduct ground-breaking research in five key areas – myopia and eye growth, ocular drug discovery and delivery, vision enhancement, tear film and ocular surface, and advanced optometric technology.

Supported by InnoHK, the flagship innovation and technology initiative of the HKSAR Government, CEVR is committed to becoming a global leader in eye and vision research as well as a magnet for attracting and training elite researchers, harnessing Hong Kong's research expertise and entrepreneurial ecosystem.

With the collaboration between The Hong Kong Polytechnic University (PolyU) and the University of Waterloo (UW) in Canada, CEVR represents a significant step in enhancing the research capacities and innovation applications aimed at addressing eye and vision health challenges, by bringing together multiple scientific disciplines based on the excellent credentials of two leading academic institutions in vision science and eye health research.
