Qmed GO 'Mini Clinics' to solve rising employee healthcare costs

Qmed Asia, a Malaysian healthcare startup, has launched Qmed GO in a bid to tackle corporate concerns on employee well-being, medical coverage, and affordability, accessibility, and standards of healthcare provided by leveraging smart IoT. Blending technology to help people, Qmed GO is among the first of its kind to reinvent mini clinics for the benefit of both employees and employers.

Formerly known as QueueMed, the company's journey began as an appointment booking and mobile live queue system provider for the medical industry. It has since evolved and expanded its market presence in the healthcare sector. Changing the brand name from "Queue" to "Q" signifies Qmed's commitment moving forward to provide quality healthcare solutions for all.

Qmed GO is Qmed's latest initiative that can conduct video consultations and remote patient management in partnership with local general practitioners (GP) on a single platform.

These "mini clinics" are intended as a one-stop centre for consultation and diagnosis designed to reduce overhead costs surrounding employee medical coverage. They come in three versions: Qmed GO, Qmed GO Plus, and Qmed GO Lite, which can be installed within the workplace premise. Doing so can reduce the long-term costs of engaging panel clinics for employees while providing essential healthcare services able to monitor vitals up to 16 parameters. Between patients, the booths can sanitize themselves using ultraviolet light; more thorough cleanings are provided by field maintenance staff. These features allow Qmed to address the golden triangle of healthcare: affordability, accessibility, and safety.
