Alpinion Medical Systems introduces latest intelligent ultrasound technology

November 10, 2022 | News

Upgraded Top-Tier 'X-CUBE 90 on GPX' and debuting value console 'X-CUBE 60' unit are among the new-generation of diagnostic ultrasound systems to be demonstrated

Alpinion Medical Systems, a subsidiary of South Korea-based ILJIN Group, plans to present a new range of high-performance diagnostic equipment at the Radiological Society of North America's (RSNA) radiology conference and annual meeting. The conference will be held in Chicago from November 27 to December 1, 2022.

Alpinion will be displaying newly upgraded X-CUBE Series: 90 and 70 on GPX and the newly launched value console unit: X-CUBE 60. The X-CUBE series aims to offer the highest level of ultrasound performance with precise clinical imaging and operational efficiency.

The X-CUBE Series 90 and 70 on GPX have undergone a comprehensive system upgrade that integrates advanced diagnostic technologies with reduced noise and artifacts to provide excellent contrast resolution delicately.

All three models are outfitted with advanced imaging acquisition technology that is capable of processing signals 4 times more, and 14 times faster than the existing platform, which allows healthcare providers to make each critical decision with maximum viewing and data interpretations and provide a precise diagnosis with confidence.

The company will also unveil the highly anticipated, performance-based portable series, the X-CUBE i9 laptop-style unit offering incisive capabilities, extended functionalities, and streamlined workflow to achieve more mobility, flexibility, and affordability to counter the ever-growing patient demand for imaging solutions — a long-sought improvement on the patient-centric approach and the accommodation that aims to benefit medical practices everywhere.
