Toshiba introduces new Ultrasound system

Toshiba America Medical Systems introduces the newest addition to its ultrasound portfolio. The Xario 100 is a small, versatile and easy-to-use ultrasound system that is ideal for any clinical setting in small hospitals, clinics, private offices and imaging centers.

The Xario 100 features a 19-inch LCD monitor with advanced imaging technologies that come from Toshiba's high-end ultrasound units, including Advanced Dynamic Flow (ADF) and Differential Tissue Harmonics (D-THI). It's designed to increase efficiency with a fully customizable console and Toshiba's iStyle Productivity Suite, an adaptable user interface providing workflow automation tools for faster exams.

"Toshiba's Xario 100 puts customers first by combining optimal image quality with easy operation, allowing clinicians to make diagnoses quickly and with confidence," said Ms Maria Piazza, director, Ultrasound Business Unit, Toshiba. She added, "The system's outstanding mobility and consistent high performance across a wide range of clinical applications make it a versatile ultrasound solution for this changing healthcare environment. Amid today's financial pressures, Toshiba is making it possible for healthcare facilities of all sizes to provide quality care to their patients."

Toshiba will showcase the Xario 100 ultrasound system at this year's Radiological Society of North America (RSNA) annual meeting in Chicago, November 29 - December 4, 2015 (Booth #7336, North Hall).
