Dengue vaccine now available in Mexico

Singapore: Dengvaxia, the dengue vaccine by Sanofi Pasteur, is now available in private healthcare clinics of Mexico for vaccination of individuals 9 to 45 years of age.

"Dengue is a major public health risk in parts of Mexico with no specific treatment available to healthcare professionals to manage outcomes with this disease," says Dr. Jos   Ramos Casta  eda, Professor of Virology and Researcher at the Center for Population Health Research of the National Institute of Public Health (INSP). "The Mexican medical community welcomes the ability to vaccinate people against dengue with the first clinical preventive tool for this often debilitating disease which continues to be a growing health issue in our country."

Dengvaxia is now approved in nine countries globally, with 4 new registrations (Paraguay, Peru, Indonesia and Guatemala) granted in the last 6 weeks following the World Health Organization's official endorsement of the vaccine's safety, efficacy and public health value in endemic countries published on July 29th.

"The private clinic launch of the dengue vaccine in Mexico is good news and follows closely CONAVA, the country's National Vaccination Council, publication of recommendations for use of the dengue vaccine which provides the framework for the nation's health authorities to consider implementation of the dengue vaccine in public programs to reduce disease burden in Mexico and reach the WHO 2020 ambition for dengue reduction," adds Dr. Cesar Mascareñas, Global Head of Medical Affairs for Dengue at Sanofi Pasteur.
