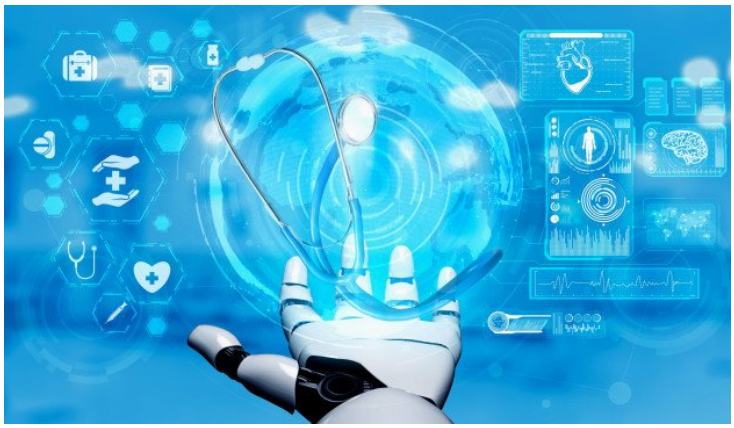
Philips new HealthSuite solutions to drive healthcare's digital transformation

August 10, 2021 | News

New Philips HealthSuite solutions break down data silos to activate secure, connected care and scalable, cost-effective innovation across the care continuum



Royal Philips, a global leader in health technology, introduced two new Philips HealthSuite solutions that are secure, cloud-based and intended to break down barriers across patient care in a scalable, cost-effective model.

During HIMSS21, Philips will showcase and introduce Philips Patient Flow Capacity Suite and Philips Acute Care Telehealth, key HealthSuite solutions that allow health systems to integrate informatics applications that can be combined and scaled up or down according to emerging needs. Philips HealthSuite solutions help health systems deliver on the quadruple aim through a connected, protected, future-ready and cost-predictive single cloud infrastructure and Software-as-a-Service (SaaS) model.

Philips HealthSuite securely stores critical healthcare data and provides both advanced analytics and AI capabilities, while delivering industry-leading interoperability to help enable precision care and provide care anywhere. With these new HealthSuite solutions, health systems can liberate data from silos and connect it in a way that enables care teams to turn data into actionable insights and collaborate to better serve patients.

Patient Flow Capacity Suite: A patient logistics solution that helps manage the patient journey across the entire care continuum. The solution helps to provide visualization and machine learning-supported analytics that can enable more informed patient flow decisions. Care is orchestrated in a structured manner across the entire healthcare network, including affiliate networks as well as post-acute settings. Patient Flow Capacity Suite connects the front lines with hospital enterprise operations to systematically predict demand, make patient transition decisions, and spot patient flow bottlenecks.

Acute Care Telehealth: Building on Philips' decades-long expertise in Tele-ICU solutions, Acute Care Telehealth provides a configurable and flexible solution to help health systems realize their virtual care and wider enterprise telehealth ambitions. The solution's scalability allows health systems to deploy Acute Care Telehealth in a centralized command center, or a decentralized model of telehealth dependent on their needs. By allowing customers to add additional hospitals, clinical units or beds, Acute Care Telehealth grows as each organization's telehealth strategy evolves.
