Agilent collaborates with APC on real-time process monitoring

May 27, 2022 | News

To bridge the gap between the analytical and process solutions

Agilent Technologies Inc. has announced a collaboration agreement with APC Ltd., in which the companies commit to working towards combining their technologies to provide unique workflows to customers that support automated process analysis via liquid chromatography (LC).

Agilent has selected to partner with APC, a provider of innovative small molecule and large molecule process design and process development solutions. Both APC and Agilent pursue similar goals, which are focused on helping customers in the biopharmaceutical and pharmaceutical industry to improve the human condition and to delivering life-changing drugs to market faster and more efficiently. The collaboration between the companies leverages their complementary strengths to develop specific workflows, which bridge the gap between the analytical and process solutions.

The results obtained during the collaboration will be shared with customers via applications notes and joint webinars, which will also showcase the recently launched InfinityLab Online LC and InfinityLab Bio LC portfolio from Agilent. These new product offerings and the collaboration with APC ensure a leading position in the trend towards continuous manufacturing, process analytical technology (PAT), and real-time release testing (RTRT) in the biopharmaceutical and pharmaceutical industry.
